HIGH DEFINITION GLASS

High Definition Glass.

The five characteristics that define and distinguish High Definition Glass:

- ★ BRILLIANCE
- ★ 'EXTRA-WHITE' TRANSPARENCY
- ★ STRENGTH
- ★ MICROWAVE SAFE
- ★ DISHWASHER SAFE

Vidivì Vetri delle Venezie manufactures products exclusively in **sodium-calcic glass**, with a low metal content. This means our glass has an extremely high brilliance, with a **refractive index of 1.51***. The effect can be compared to the brilliance of crystal but, unlike the latter, our glass contains no lead and can be 100% recycled.

HD Glass boasts the description '**extra-white**', in so much as the iron content is almost non-existent, causing its '**white**' colouring, free of any green, blue or yellow nuances. At 3 mm thick, High Definition Glass **transmits light at 92%**, as proved by research carried out by the Laboratorio Analisi Vetterie Riunite.

Thanks to the purity of the raw materials used and the manufacturing process, High Definition Glass is considered particularly resistant to impacts and mechanical stress. Furthermore, as **pressed and annealed glass**, it has proven to be extremely **safe**, above average compared to other products on the market. In fact, when submitted to the 'Safety Test', results demonstrated that it does not fracture or explode when exposed to impact or stress.
